Main Economic Indicators for Agriculture and Manufacturing of Food, Beverages and Tobacco

Indicator	Period	Sector	Value	Inter-annual variation	%/Total Spain
GVA Millions €	2012	Total	944,219	-1.6%	100.0%
		Agricultural	23,215	-2.9%	2.5%
		FBT Industry	27,582	12.0%	2.9%
Employed thousand people	II Q 2014	Total	17,353.0	1.1%	100.0%
		Agricultural	739.3	-1.8%	4.3%
		FBT Industry	477.2	8.6%	2.7%
Unemployment Rate (%)	II Q 2014	Total	24.5%*	-1.6	
		Agricultural	26.1%*	-0.2	
		FBT Industry	9.7%*	-4.1	

(* The difference between two percentages is expressed as percentage points differential.

Agricultural sector: Agriculture, Livestock, Fisheries and Forestry.

FBT: Food, Beverages and Tobacco Industry

GVA: Gross value added.

Data Source: INE (National Statistics Institute, Spain)

National accounts and Labour Force Survey.

ENVIRONMENTAL ACCOUNTS:

HOW TO MEASURE INTERACTION BETWEEN ECONOMY AND ENVIRONMENT

The purpose of Environmental Accounts (E.A) is to track the links between the environment and the economy. The accounts measure the economy impact on the environment, and the contribution of the environment to the economy, using the accounting framework and concepts of the national accounts. E.A can be used to analyse the impact of current production and consumption patterns on natural resources and the environment, and the effects of economic policy measures, in order to achieve the principles of Europe 2020 strategy for a "Green Economy". See: EUROSTAT, *Environmental Accounts, What do E.A measure?: http://epp.eurostat.ec.europa.eu/portal/page/portal/environmental_accounts/introduction*.

Regulation (EU) 691/2011 on European environmental economic accounts establishes 3 modules: Air emissions accounts, environmentally related taxes by economic activity, and economy-wide material flow accounts. In 2014 a new Regulation (EU) No 538/2014 was published adding 3 additional modules: Environmental protection expenditure accounts, environmental goods and services accounts, and physical energy flow accounts.

Spanish National Statistics Institute (INE) is in charge of calculating the E.A and has recently published the results obtained for the three first modules (data: 2011).

Air Emissions Accounts: Spain emitted in 2011 more than 350 million tonnes of CO₂-equivalent of Greenhouse Gases (GHG) having reduced its emissions by 12.2% since 2008. The UE 28 emitted in 2011 a total of 4,600 million tonnes of CO₂-eq. with a reduction of 8.0% in the same period.

Environmental taxes: These taxes base those products who have a specific proved negative impact over the environment (hydrocarbons, electricity, waste, etc). In 2011, the total amount of taxes collected in Spain was 16,677 million €. This figure accounts for 16% of total tax income and almost a 1.6% of the GDP, whereas in the UE28 represents the 2.4%.

Material flows: Measures the total flow of materials (solid, liquid or gaseous) between economy and their environment, and between national and international economies. There are two main indicators. The *material productivity*, calculated as GDP (€) per national material utilisation (tonnes): 2,022 €/t in Spain (+50.4% since 2008) and 1,720 €/t. in UE 27; and the *material consumption per inhabitant*: 11.2 t/inh in Spain (-36,7% s/2008) and 14,7 t/inh. in UE 27.

Data source: Agricultural yearbook, Ministry of Agriculture, Food and Environment.

(1) Includes secondary pasture areas and wasteland.

(2) Includes urban uses and other artificial uses (roads, railways, industry, mining, etc.)

12. FORESTRY AND WOOD INDUSTRY. In II Q 2014 employed people in forestry and logging, and in manufacture of paper, increases by 4.3% and 8.9% compared to 2013; whereas, in manufacture of wood and cork, decreases by 1.2%. Economic value of wood pruning and firewood extraction shows a increasing trend since 1992.
